

stats 6:

(1) Bangalore to Chennai

$$n_1 = 1200$$

$$\bar{x}_1 = 452$$

$$s_1 = 212$$

Bangalore to Hosur

$$n_2 = 800$$

$$\bar{x}_2 = 523$$

$$s_2 = 185$$

$$t = \frac{(\bar{x}_1 - \bar{x}_2) - (\mu_1 - \mu_2)}{\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}}$$

$$t = \frac{(452 - 523) - 0}{\sqrt{\frac{(212)^2}{1200} + \frac{(185)^2}{800}}}$$

$$t = \frac{-71}{\sqrt{37.45 + 42.78}} = \frac{-71}{8.96}$$

$$t = \underline{\underline{-7.92}}$$

Hypothesis statements:

$$H_0 : \mu_{B \rightarrow C} = \mu_{B \rightarrow H}$$

$$H_1 : \mu_{B \rightarrow C} \neq \mu_{B \rightarrow H}$$

degree freedom :  $x_1 + x_2 \rightarrow n_1 + n_2 - 2$

$$\begin{aligned} df &= n_1 + n_2 - 2 \\ &= 1200 + 800 - 2 \\ &= 1998. \end{aligned}$$

As the degree freedom is very high and considering 95% interval  
tabulated  $\approx \pm 1.96$

Since  $t_{\text{critical}} < t$ ,  $\therefore$  rejecting the null hypothesis ( $H_0$ ).  
 $\therefore$  the number of people travelling from Bangalore to Chennai is different from number of people travelling from Bangalore to Hosur.

(2) Problem Statement 2:

Hypothesis Statement

$\mu_1 > \mu_2$  by 45.

$H_0 : \mu_1 - \mu_2 = 45$

$H_1 : \mu_1 - \mu_2 \neq 45$

Data

$$n_1 = 100$$

$$x_1 = 308$$

$$s_1 = 84$$

Chennai

$$n_2 = 100$$

$$x_2 = 254$$

$$s_2 = 67$$

$$t = \frac{(\bar{x}_1 - \bar{x}_2) - (\mu_1 - \mu_2)}{\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}}$$

$$= \frac{(308 - 254) - 45}{\sqrt{\frac{84^2}{100} + \frac{67^2}{100}}} = \frac{9}{\sqrt{70.50 + 44.89}}$$

$$\frac{9}{10.74} = 0.837$$

$$t = 0.837$$

degree freedom (df) =  $n_1 + n_2 - 2$

$$= 100 + 100 - 2$$

$$df = 198$$

$$t_{critical} = \pm 1.984 \quad \alpha = 0.05$$

Since  $t_{critical} > t$ , unable to reject the null hypothesis.

Problem Statement 3:

Hypotheses statement:

$$H_0: \mu_1 - \mu_2 = 0$$

$$H_1: \mu_1 - \mu_2 \neq 0$$

given data:

Population 1: Price of Sugar = Rs. 27.50

$$n_1 = 14$$

$$\bar{x}_1 = 0.317\%$$

$$s_1 = 0.12\%$$

Population 2: Price of Sugar = Rs. 20.00

$$n_2 = 9$$

$$s_2 = 0.11\%$$

$$\bar{x}_2 = 0.21\%$$

degree of freedom  $df = n_1 + n_2 - 2$

$$df = 14 + 9 - 2$$
$$\boxed{df = 21}$$

$$S_p^2 = \frac{(n_1 - 1)S_1^2 + (n_2 - 1)S_2^2}{n_1 + n_2 - 2}$$

$$= \frac{(14 - 1)(0.12)^2 + (9 - 1)(0.11)^2}{21}$$

$$= \frac{0.1842 + 0.0968}{21}$$

$$\boxed{S_p^2 = 0.0135}$$

$$t = \frac{(\bar{x}_1 - \bar{x}_2) - (\mu_1 - \mu_2)}{S_p \sqrt{\frac{1}{n_1} + \frac{1}{n_2}}}$$

$$t = \frac{(0.317 - 0.21) - 0}{0.176 \left( \sqrt{\frac{1}{14} + \frac{1}{9}} \right)}$$

$$= \frac{0.107}{0.126 \left( \sqrt{0.071 + 0.111} \right)} = \frac{0.107}{0.0494}$$

$$t = 2.165$$

critical at  $\alpha = 5\%$  is 2.080. Since  $t_{critical} < t$ ,  
we are rejecting the null hypothesis.

# Problem Statement 4:

## Givendata

### Population 1

$$\begin{aligned}n_1 &= 15 \\ \bar{x}_1 &= \text{Rs. } 6598. \\ s_1 &= \text{Rs. } 844.\end{aligned}$$

### Population 2

$$\begin{aligned}n_2 &= 12 \\ \bar{x}_2 &= 6870 \\ s_2 &= 669.\end{aligned}$$

### Hypothesis Statement

$$H_0: \mu_1 = \mu_2 \text{ (no increase in sales)}$$

$$H_1: \mu_1 \neq \mu_2 \text{ (increase in sales)}$$

$$t = \frac{(\bar{x}_1 - \bar{x}_2) - (\mu_1 - \mu_2)}{s_p \sqrt{\frac{1}{n_1} + \frac{1}{n_2}}}$$

$$s_p = \sqrt{\frac{(n_1 - 1)s_1^2 + (n_2 - 1)s_2^2}{n_1 + n_2 - 2}}$$

$$s_p = \sqrt{\frac{(15 - 1)(844)^2 + (12 - 1)(669)^2}{15 + 12 - 2}}$$

$$s_p = 771.903.$$

$$t = \frac{(6568 - 6870) - 0}{771.903 \sqrt{\frac{1}{15} + \frac{1}{12}}}$$

$$t = -0.909$$

$$\text{degree of freedom } df = n_1 + n_2 - 2$$

$$= 15 + 12 - 2$$

$$= 25$$

Consider  $\alpha = 10\%$ . it is a 2 tailed test  $\alpha/2$

$$t_c = \pm \underline{1.676}$$

$t_c \leq t$  rejecting the null hypothesis.

Problem statement 5:-

Given Data

Population 1

$$n_1 = 1000$$

$$x_1 = 53$$

$$p_1 = 0.53$$

Population 2

$$n_2 = 100$$

$$x_2 = 43$$

$$p_2 = 0.43$$

Hypotheses statement

$$H_0 : \mu_1 - \mu_2 = 0$$

$$H_1 : \mu_1 - \mu_2 \neq 0$$

$$t = \frac{(p_1 - p_2) - (\mu_1 - \mu_2)}{\sqrt{\hat{p}(1-\hat{p})\left(\frac{1}{n_1} + \frac{1}{n_2}\right)}}$$

$$\hat{p} = \frac{x_1 + x_2}{n_1 + n_2}$$

$$\hat{p} = \frac{53 + 43}{1000 + 100} = \frac{96}{1100} = 0.087$$

$$t = \frac{0.53 - 0.43 - 0}{\sqrt{0.087(1-0.087)\left(\frac{1}{1000} + \frac{1}{100}\right)}}$$

$$= \frac{0.1}{\sqrt{0.087(1-0.087)\left(\frac{1}{1000} + \frac{1}{100}\right)}}$$

$$\frac{0.1}{\sqrt{0.087 \times 0.913 \times 0.011}} = \frac{0.1}{0.03}$$

$$t = 3.33$$

$t_{critical}$  at  $\alpha = 10\%$ .

$$t_{critical} = 1.645$$

Since  $t_{calculated} < t$ , we are rejecting the null hypothesis.

Since the value of the test statistics is above the critical point even at a 10% level of significance, we may conclude that there is a statistically significant difference between bank shares of Car loan in 1980 and 1995.

Problem Statement 6:

Given data:

Population 1:

$$n_1 = 300$$

$$x_1 = 120$$

$$p_1 = 0.40$$

Population 2:

$$n_2 = 700$$

$$x_2 = 140$$

$$p_2 = 0.20$$

Hypotheses statement:

$$H_0: \mu_1 - \mu_2 \leq 10\% (0.10)$$

$$H_1: \mu_1 - \mu_2 > 10\% (0.10)$$

$$t = \frac{(p_1 - p_2) - (\mu_1 - \mu_2)}{\sqrt{\hat{p}(1-\hat{p}) \left( \frac{1}{n_1} + \frac{1}{n_2} \right)}}$$

$$\hat{p} = \frac{x_1 + x_2}{n_1 + n_2} = \frac{120 + 140}{300 + 700} = \frac{260}{1000} = 0.26$$

$$b = (0.40 - 0.20) = 0.10$$

$$\sqrt{0.26(1-0.26)\left(\frac{1}{300} + \frac{1}{700}\right)}$$

$$= \frac{0.20 - 0.10}{\sqrt{0.26 \times 0.74 \times 0.0047}}$$

$$= \frac{0.10}{0.030} = 3.33$$

$Z_{critical}$  at  $\alpha = 1\%$

$$Z_c = 3.09$$

Since  $Z_c < Z$ ,  $H_0$  may be rejected.

Since the value of the test statistics is above the critical point example level, significant or smaller 0.001 the null hypotheses may be rejected. and we may conclude that the proportion of customers buys at least \$2500 of travel agency checks at least 10% higher than sweepstakes even.

Problem Statement 7: Green dollar

A die is thrown 132 times.

Recorded up 1, 2, 3, 4, 5, 6.

Frequencies: 16, 20, 25, 14, 29, 28.

Hypothesis statement

$H_0$ : die is unbiased.

$H_1$ : die is biased.

	observed	Expected frequency $(n \times \frac{1}{6})$
$x=1$	16	22
		22
$x=2$	20	22
	25	22
$x=3$		22
$x=4$	14	22
	29	22
$x=5$		22
	28	
$x=6$		

$$\chi^2 = \sum \frac{(O - E)^2}{E}$$

$$= \frac{1}{22} \left[ (16-22)^2 + (20-22)^2 + (25-22)^2 + (14-22)^2 + (29-22)^2 + (28-22)^2 \right]$$

$$= \frac{1}{22} [36 + 4 + 9 + 64 + 49 + 36]$$

$$\boxed{\chi^2 = 9}$$

Degree of freedom =  $n-1$

$$= 6-1 = 5$$

From Chi-square table Critical value  $\chi_c^2 = 11.07$

$$\chi_c^2 > \chi^2$$

Since the test statistics critical value is greater than test value, unable to reject the null hypothesis. (It is discussed below)

Problem statement 8:-

	Men	Women	Total
voted	2792	2591	6383
Not voted	1486	2131	3617
	4278	5722	10000

Hypotheses Statement:-

$H_0$ : Gender and voting are independent.

$H_1$ : Gender and voting are dependent.

$$\text{Men voted} = \frac{6383 \times 4278}{10000} = 2730$$

$$\text{Women voted} = \frac{5722 \times 6383}{10,000} = 3652$$

$$\text{Men not voted} = \frac{4278 \times 3617}{10,000} = 1547$$

$$\text{Women not voted} = \frac{5722 \times 3617}{10,000} = 2069$$

$$\chi_b^2 = \sum \left[ \frac{(O - E)^2}{E} \right]$$

$$= \frac{(2792 - 2730)^2}{2730} + \frac{(3591 - 3652)^2}{3652} + \frac{(1486 - 1547)^2}{1547} + \frac{(2131 - 2069)^2}{2069}$$

$$\chi^2 = 6.689$$

$$\text{Degree of freedom } df = (n-1)(n-1) \\ = (2-1)(2-1) \\ = 1$$

From chi-square table

for 95%  $\rightarrow \chi^2_{critical}$

$$= 3.84 (\alpha = 0.05)$$

$$\chi^2 < \chi^2_{critical}$$

So, regarding the null hypothesis which indicates that Gender and votes are independent.

Problem statement 9:-

Given data:

$n = 100$  (Sample votes)

Observation for 4 Candidates

Higgins	Reardon	White	Challin
41	19	24	16

$$\chi^2 = 14.96$$

$$df = 3$$

$$\alpha = 0.05 \rightarrow 5\%$$

Hypothesis statement

$H_0$ : All candidates are equally popular.

$H_1$ : All candidates are not equally popular.

Expected value  $E_i = \frac{100}{4} = 25$  (Equal probability)

$$\chi^2 = \sum \left( \frac{(O_i - E_i)^2}{E_i} \right)$$

$$= \frac{1}{25} \left[ (41-25)^2 + (19-25)^2 + (24-25)^2 + (16-25)^2 \right]$$

$$= \frac{1}{25} [256 + 36 + 1 + 81]$$

$$\chi^2 = 14.96$$

$df = 3$   $\chi^2_{critical} = 7.81$  at  $\alpha = 0.05$

$$\chi^2_{critical} < \chi^2$$

so rejecting the null hypothesis. All the

Candidates are not equally popular

Problem statement is

	A	B	C	
5-6	18	22	20	60
7-8	2	28	40	70
9-10	20	10	40	70
	40	60	100	200

$$\chi^2 = 29.4, df = 4, \alpha = 0.05$$

Hypothesis statement:

$H_0$ : No relationship between age and photograph preferences.

$H_1$ : Relationship is there between age and photograph preferences.

$$\text{Age group (5-6) for A} = \frac{40 \times 60}{200} = 12.$$

$$\text{Age group (5-6) for B} = \frac{60 \times 60}{200} = 18$$

$$\text{Age group (5-6) for C} = \frac{60 \times 100}{200} = 30.$$

$$\text{Age group (7-8) for A} = \frac{40 \times 70}{200} = 14$$

$$\text{Age group (7-8) for B} = \frac{60 \times 70}{200} = 21$$

$$\text{Age group (7-8) for C} = \frac{100 \times 70}{200} = 35$$

$$\text{Age group (9-10) for A} = \frac{40 \times 70}{200} = 14.$$

$$\text{Age group (9-10) for B} = \frac{60 \times 70}{200} = 21.$$

$$\text{Age group (9-10) for C} = \frac{100 \times 70}{200} = 35.$$

$$\chi^2 = \sum \left[ \frac{(O_i - E_i)^2}{E_i} \right]$$

$$= \frac{(18-12)^2}{12} + \frac{(22-18)^2}{18} + \frac{(20-30)^2}{30} + \frac{(2-34)^2}{14} + \frac{(28-21)^2}{21} + \frac{(40-35)^2}{35} + \frac{(20-14)^2}{14} + \frac{(10-21)^2}{21} + \frac{(40-35)^2}{35}$$

$$\boxed{\chi^2 = 29.6}$$

$$\text{degree of freedom} = (n-1)(n-1) \\ = (3-1)(3-1)$$

$$df = 4$$

$$\chi^2 = 9.49$$

Critical

$$\chi^2_{\alpha} < \chi^2$$

Since Critical value is less than the  $\chi$  value. rejecting the null hypothesis.

It indicates that there is a significant relationship between aged photograph preferences.

Problem Statement II :-

	Support	No Support	
Conform	18	40	58
Not Conform	32	10	42
	50	50	100

$$\chi^2 = 19.87, df = 1, \alpha = 0.05$$

Hypothesis Statement :-

$H_0$  : No significant difference between the support and no support condition.

$H_1$  : Significant difference between the support and no support condition.

$$\text{Conform Support} = \frac{50 \times 58}{100} = 29$$

$$\text{Conform Non-Support} = \frac{58 \times 50}{100} = 29$$

$$19.87 = \chi^2$$

$$\text{not Conform Support} = \frac{50 \times 42}{100} = 21$$

$$\text{not Conform Support} = \frac{50 \times 42}{100} = 21$$

Chi-Square distribution

$$\chi^2 = \sum \left[ \frac{(O_i - E_i)^2}{E_i} \right]$$

$$\chi^2 = \frac{(18-29)^2}{29} + \frac{(40-29)^2}{29} + \frac{(32-21)^2}{21} + \frac{(10-21)^2}{21}$$

$$= \frac{121}{29} + \frac{121}{29} + \frac{121}{21} + \frac{121}{21}$$

$$\chi^2 = 19.868$$

$$\text{degree freedom df} = (2-1)(2-1) = 1$$

$$\chi^2_{\text{critical}} = 3.84 \mid \alpha = 0.05$$

$$\chi^2_{\text{critical}} < \chi^2$$

So rejecting the null hypothesis.

This indicates that there is a significant difference between the support and no support.

$$\chi^2 = \sum \left[ \frac{(O_i - E_i)^2}{E_i} \right]$$

$$\chi^2 = \sum \left[ \frac{(O_i - E_i)^2}{E_i} \right]$$

# Problem Statement 121-

	Short	Tall	
Leader.	12	32	44
Follower	22	14	36
Unclassifiable.	9	6	15
	43	52	95

$$\text{Leader - Short} = \frac{43 \times 44}{95} = 19.92$$

$$\text{Leader - Tall} = \frac{52 \times 44}{95} = 24.08$$

$$\text{Follower - Short} = \frac{43 \times 36}{95} = 16.29$$

$$\text{Follower - Tall} = \frac{52 \times 36}{95} = 19.79$$

$$\text{Unclassifiable - Short} = \frac{43 \times 15}{95} = 6.79$$

$$\text{Unclassifiable - Tall} = \frac{52 \times 15}{95} = 8.21$$

$$\text{Degree of freedom} = (n_1 - 1)(n_2 - 1) = (2 - 1)(3 - 1)$$

$$\boxed{df = 2}$$

Since we have 3x2 table and (len of c = 2) we will work out chi-square incorporating correction for continuity

$$\chi^2 = \sum \left[ \frac{(O_i - E_i)^2}{E_i} \right]$$

$$\chi^2 = \sum \left[ \frac{(O_i - E_i)^2}{E_i} \right]$$

$$= \frac{(12 - 19.92)^2}{19.92} + \frac{(32 - 24.08)^2}{24.08} + \frac{(22 - 16.29)^2}{16.29} + \frac{(14 - 19.71)^2}{19.71} \\ + \frac{(9 - 6.79)^2}{6.79} + \frac{(6 - 8.21)^2}{8.21}$$

$$\chi^2 = 10.712$$

$$\chi^2_{\text{critical}} = 5.991$$

10.712 is greater than  $\chi^2$  at 0.01, significance level. Hence there is a relationship between heights and leadership qualities.

Problem Statement 13:

	Married.	Widowed / Divorced.	Never married.
Employed.	679	103	114
Unemployed.	83	10	20
Not in labor force.	42	18	25

$$\text{Employed \& married} = \frac{784 \times 896}{1074} = 654.063.$$

$$\text{Employed \& widowed, divorced} = \frac{131 \times 896}{1074} = 109.288$$

$$\text{Employed \& never married} = \frac{159 \times 896}{1074} = 132.648.$$

$$\text{unemployed \& married} = \frac{784 \times 93}{1074} = 67.889.$$

$$\text{unemployed \& divorced} = \frac{131 \times 93}{1074} = 11.343.$$

$$\text{unemployed \& never married} = \frac{159 \times 93}{1074} = 13.763.$$

$$\text{Not in labor \& married} = \frac{784 \times 85}{1074} = 62.043$$

$$\text{Not in labor \& widowed/divorced} = \frac{131 \times 85}{1074} = 10.367$$

$$\text{Not in labor \& never married} = \frac{159 \times 85}{1074} = 12.583$$

$$\chi^2 = \sum \left[ \frac{(O_i - E_i)^2}{E_i} \right]$$

$$= \frac{(679 - 654.063)^2}{654.063} + \frac{(103 - 109.288)^2}{109.288} + \frac{(114 - 132.648)^2}{132.648}$$

$$+ \frac{(63 - 67.888)^2}{67.888} + \frac{(10 - 11.343)^2}{11.343} + \frac{(20 - 13.763)^2}{13.763}$$

$$+ \frac{(62 - 62.043)^2}{62.043} + \frac{(18 - 10.367)^2}{10.367} + \frac{(25 - 12.583)^2}{12.583}$$

$$\chi^2 = 31.616$$

$$df = (n-1)(n-1) = (3-1)(3-1) = 4$$

$$\alpha = 0.05 \quad \chi^2_c = 9.49$$

$$\chi^2_c < \chi^2 \text{ so rejecting the null hypothesis. it indicates}$$

that men of different marital status have different distribution of labor force status.
